# DC Single-Acting High Performance Solenoids 

## G TC A

## Function

- Increasing magnetic force vs. stroke characteristic
- Push and pull type

## Construction

- Robust closed cylindrical design
- Fastening with flange or through three tapped holes
- 7 sizes $\varnothing(\mathrm{mm}) 40,50,60,70,80,90,100$
- Armature guided in maintenance free bearings. High service life
- Insulation materials of the excitation winding correspond to thermal class F
- Electrical connection via free flexible lead ends

Fig. 1: Type G TC A 090 X43 A02 or connector plug type Z KB according to DIN EN 175301-803

- Protection class according to DIN VDE/DIN EN 60529, when properly installed
- Free flexible lead ends IP 00
- Receptacles according to DIN 46247 IP 00
- Plug connection via connector plug Z KB IP 54

## Application examples

- Tooling machines, packing machines, textile machines
- Measuring and control technology

## Options and accessories

- Delivery with and without flange

Fig. 2: Force vs. stroke characteristic

- Horizontal characteristic on request
- Double acting execution (type GTUW, sep. part list)
- Energy or force optimisation by operation with holding current reduction type Z KD H 211 (sep. part list)
- Plug connectors
- without rectifier type

Z KB X 211 B01

- with rectifier type

Z KB G 211 A02

- Fork joint (type Z GA)

## Standards

- Design and testing according to DIN VDE 0580
- Quality management to ISO 9001

## Note on the tables

The magnetic force values stated in the tables refer to series G TC A ... X 43 A01 with 90 \% rated voltage and the normal operation condition. This was determined according to VDE 0580 $\S 35$ on a poor heat conducting base.

For other rated voltages deviations of the magnetic force may occur. The magnetic force values may deviate by approx. $\pm 10 \%$ due to natural dispersion.

## Current load connector plug

For versions with connector plug (G TC A ...X43 A01/A02) is has to be observed that the max. admissible rated current is 10 A .
The rated current is calculated from the rated voltage and the rated power P20 indicated in the tables on page 2 and 3 :

Example:
Rated voltage: 12 V
Rated power GTCA $1005 \%$ ED: 855W
Calculation of the rated current:
$I_{20}=\frac{P_{20}}{U_{N}}=\frac{855 \mathrm{~W}}{12 \mathrm{~V}}=71,25 \mathrm{~A}$
In this case the current admissible for the mating connector is exceeded; it must be switched to a version with free lead ends.

The normal operating condition is based on:
a) Rated voltage $=24 \mathrm{~V}$
b) Operating mode S1 (100 \%)
c) Reference temperature $35^{\circ} \mathrm{C}$

## Rated voltage

Rated voltage $=-24 \mathrm{~V}$. For versions with connector, the exciter coil can be adjusted to a rated voltage of max. $=250 \mathrm{~V}$ on request.

Standard values for voltage and operating mode: $24 \mathrm{~V}, \mathrm{~S} 1$ (100\%).
The devices with free lead ends G TC A ... X20 A01/A02 (fig. $5 / 6$ ) comply with protection class III. Electrical equipment of protection class III may be only connected to low voltage systems (PELV, SELV)(IEC 60364-4-4-41). For DC the design limits of the equipment is a rated voltage not higher than 120 V (EN 61140:2002). On request we are pleased to check to what extent the delivery of higher rated voltages is possible as special solutions by agreement.

## Note on the application of series G TC A <br> via rectifier

The connection to the AC network is possible when using a rectifier. Under consideration of the admissible current (max. 2A, see derating curve in part list $Z \mathrm{~KB}$ X...) the plug connector Z KB G 211 A02 may be used. With higher currents it is required to install a separate rectifier outside the solenoid.

It is to be observed that the AC networks are largely free of voltage peaks. If bigger inductances and capacities are switched very close to the devices, it must be ensured that these voltage peaks are rendered ineffective by suitable switching means (throttle resp. bond-pass filters).

Information and remarks concerning European directives can be taken from the correspondent information sheet which is available under Produktinfo.Magnet-Schultz.com.

Please make sure that the described devices are suitable for your application. Our offers for these devices are based on the assumption of maximal 8 in an FMEA severity table, i. e. in case of malfunction of the device model as offered, there is, amongst others, no jeopardy of life or limb. Supplementary information concerning its proper installation can be taken also from the $m^{m}$-Technical Explanation, the effective DIN VDE0580 as well as the relevant specifications.

This part list is a document for technically qualified personnel. The present publication is for informational purposes only and shall not be construed as mandatory illustration of the products unless otherwise confirmed expressively.

## Operation of devices type GTCA with holding current reduction Z KD H 211 A02

The operation of solenoids with control electronics Z KD H offers the possibility to optimise the device with regard to actuation force or energy efficiency.

## Optimizing of the actuation force (overexcitation)

The solenoid has to be equipped with an adapted winding ex factory. This winding features a reduced resistance and thus achieves a higher performance with rated voltage. The thermal overload by increased performance of the solenoid is avoided by the fact that after the actuation pulse duration of 300 ms the holding current reduction Z KD H 211 lowers the current on a reduced holding current to be set according to the admissible holding performance.

In order to illustrate the efficiency of the combination of solenoid and electronic control system, the achievable actuation forces and/ or holding force are illustrated by the example of a special winding which is designed for a cycle time of $300 \mathrm{~s}(5 \mathrm{~min}), 100 \%$ duty cycle (= no pause between 2 switching cycles) and the actuation pulse duration of 300 ms which is permanently set in the electronic system (HSA, 100\%).

The indicated actuation forces result from the actuation current $\mathrm{I}_{\mathrm{A}}$ of max. 10 A in consideration of the admissible voltage tolerances.

By reducing the duty cycle (pause between 2 switching cycles) further increases of the actuation performance and thus the actuation forces are possible with other winding designs. With the same winding it is possible to increase the holding current by reducing the duty cycle and thus to achieve higher holding forces.

For additional technical data see table on page 7

## Optimizing of the energy efficiency

To increase the energy efficiency of the solenoid the holding current reduction Z KD H 211 is used with the standard winding 100 \%, without any further adaption. The holding force is adjusted via the holding current at the electronics.

For further information please refer to part list Z KD H 211 and the related operating manual.

We will be pleased to assist you in finding a solution for your electromagnetic task. Please contact the technical office responsible for you.

Technical data for the operation with holding current reduction Z KD H 211, exemplary for special winding HSA (cycle time 300s, duty cycle $100 \%$ )

Please do not hesitate to ask for our assistance with the solution of your application-oriented task. In order to find rapidly a reliable solution we need complete details about your application conditions. The details should be specified as precisely as possible in accordance with the relevant $\mathrm{m}^{\mathrm{m}}$-Technical Explanations.
If necessary, please request the support of our corresponding technical office.
